2.1. One-Sample Problem. Suppose the lifetimes from n patients T_1, \dots, T_n are independent and identically distributed with survivor function $S(t) = P(T_i \geq t)$ and cumulative hazard function $\Lambda(t) = -\log S(t)$. From patient i , we observe (X_i, δ_i) , where X_i is the minimum of T_i and censoring time C_i , and δ_i is an event

indicator taking 1 if patient i had an event and 0 otherwise.
