Integrated circuits are manufactured by patterning multiple layers of semiconductor materials, metals and dielectrics. In a full-custom IC, all such layers are patterned according to user specifications. Fabricating a particular design requires wafers to go through all processing steps under control of a full set of lithographic photomasks all of which are made to order for this

- Design custom ICs, typically in support of lab programs
- Generally, these ICs have many channels and are connected to some sort of sensor, transducer, ... at the front-end, do some sort of signal acquisition/processing, and send information, usually digital, off the back end of the chip
- We conceptualize the design, implement it electrically and produce the data needed to prepare the masks
- We don't actually fabricate the ICs - we use commercial IC processes
