Hyblean foreland, the Gela foredeep, the Apenninic-Maghrebian orogen, and the Calabrian Arc. The orogen represents a fold-thrust belt that folds Mesozoic carbonates, while a major volcanic unit is found in an eastern portion of the island. The collision of Africa and Eurasia is a retreating subduction system,

Geology The geology of Sicily is similar to that of other Mediterranean islands, which were conditioned by the slow contraction of the vast ocean between Africa and Eurasia. In the last 50 million years, this process has pushed the predominantly limestone sea bed of the Cretaceous period toward the surface,
