very large, making a census or a complete enumeration of all the values in the population impractical or impossible. The sample represents a subset of manageable size.

Populations and Samples | Boundless Statistics

A sample is a smaller group of members of a population selected to represent the population. In order to use statistics to learn things about the population, the sample must be random. A random sample is one in which every member of a population has an equal chance of being selected. The most commonly used sample is a simple random sample.

Populations, Samples, Parameters, and Statistics

A well chosen sample will contain most of the information about a particular population parameter but the relation between the sample and the population must be such as to allow true inferences to be made about a population from that sample.

A population simply refers to the entire set of people or things of interest to our analysis. A sample represents a smaller subset of the population. A set of people or things can be either a population or a sample depending on the circumstances. Consider the people we studied in our lesson on correlation.

A population is the entire group that you want to draw conclusions about. A sample is the specific group that you will collect data from. The size of the sample is always less than the total size of the population. In research, a population doesn't always refer to people.

Making Sense of Our Big Data World: Samples, Populations ...

To summarize, the sample is the group of individuals who participated in the study and the population is the broader group to whom the results will apply. Measurements on the entire population is too complex or impossible, so representative samples are used to draw conclusions about the population.

The sample is a subset of the population, and is the set of values you actually use in your estimation. Let's think 1000 individual you have selected for your study to know about average height of the residents of India. This sample has some quantity computed from values e.g. mean (\bar{x}), Standard deviation (s), sample proportion etc.

Samples and Populations (cont.) Examples: In the cow data set: | the sample is the 50 cows; | the population is cows of the same breed on dairy farms. In the plantation example: | the sample is the three sites where data was collected; | the population is all plantations in Costa Rica where one might consider restoration to native forest.
