Slope Failure is the movement of mass on slope (falls, slides, flows) Landslide: involves an extensive area, mild slope (<20°), movement is slow and gradual. Slope Failure: limited area, steep slope, movement is fast (sometimes with no signs) The stability of a slope should be evaluated when slope movement due to additional

The goal of a slope stability analysis is to determine the conditions under which the mass will slip relative to the base and lead to slope failure. [15] If the interface between the mass and the base of a slope has a complex geometry, slope stability analysis is difficult and numerical solution methods are required.
